Flowmon ADS

Whenever new security or operational issues arise, Flowmon ADS (Anomaly Detection System) gives back control to IT professionals. Leveraging its powerful network behavior analytics, IT professionals can take decisive actions, deal with cyber threats and manage networks with confidence.

Flowmon ADS

Protecting values through technology

Utilizing advanced artificial intelligence, Flowmon's behavior analytics engine permanently observes and analyses data communication seeking anomalies, revealing suspicious behavior. Thanks to this ADS eliminates risks that bypass traditional solutions such as firewall or antivirus.

The solution provides administrators with accurate information on what is happening in the network, taking the entire security to the next level while saving time and money.

The main advantage lies in the combination of techniques. This includes orientation on the overall behavior of devices in the network, incorporated threat intelligence feeds, visibility into local network and more. This is the only efficient way to respond to still unknown or specific threats for which the signature is not available.

Flowmon ADS deployment is seamless and non-intrusive. Leverage your existing network equipment to feed ADS with flow data and maximise the return of your past investments.

Get protected NOW

Responding to modern cyber threats requires an approach that is lightweight and yet professional.

Visit www.flowmon.com to download the free trial of Flowmon ADS and experience how it can help your organization.

Smart Detection

State-of-the-art security intelligence equipped with methods to alert on advanced threats, botnets, unknown malware, violation of policies or operational issues automatically.

Fast Resolution

When prevention fails, ADS will detect and help you to respond and recover your business as usual. It is a gear helping all IT teams to collaborate on fast incident resolution.

Strategic Approach

Modern attacks are designed to slip under firewall and antivirus radar. ADS unveils threats hiding in the dark places of your network, providing fundamental data for SIEM.

Ease-of-Use

ADS starts protecting your business within hours after deployment, providing unprecedented ROI in the field.

"ADS functionality decreases the time needed to evaluate potential risks so we can focus on other important activities knowing that everything is under control."
